

**Figure 1.** A schematic diagram illustrating the experimental design. The figure shows a sequence of events starting from a subject's arrival at the laboratory. The subject is first familiarized with the task and then performs a series of trials. Each trial consists of a stimulus presentation phase followed by a response phase. The stimulus presentation phase involves the subject viewing a screen displaying a target location. The response phase involves the subject moving their hand to the target location. The diagram also indicates the timing of the stimulus presentation and the response phase relative to the subject's movement.
